

Center for the Study of Lithiasis and Pathological Calcification

The Center for the Study of Lithiasis and Pathological Calcification is under experimental pathology. This is the study of disease processes via the examination of cells, tissues or organs or bodily fluids from diseased organisms. The Department's Experimental Pathology Division is composed of a diverse group of investigators who research the disease mechanisms. Their research covers five overlapping areas, including:

- Cancer Research
- Emerging Pathogens
- Immunology/Autoimmunity
- Nephrolithiasis
- Stem Cell Research
